## ABSTRACT

The topic of choosing a research site in Cao Bang province of Vietnam, the purpose is to build a data of medicinal plants that are eaten by animals and humans (vegetable plants, edible plants (seeds/fruits), plants for food animals). Data is built based on references, fieldworks, information of specimens located at herbaria (HN, VNM). Identification of plant specimens based on morphological comparison method. Collection of use value information of plant species based on references related to medicinal plants and useful plants. Application of Microsoft Access to analyze data. A list of 216 medicinal plant species that are eaten by animals and humans in Cao Bang province has been compiled. A model built for research and development of those species based on comprehensive cooperations and supports from agencies of agriculture, construction, essential oil, fashion, forestry, medicinal plants, ornamental plants. The agencies can support the research and development of 216 species. Each species can be supported by several agencies: 2 species can be supported by 5 agencies. 9 species can be supported by 4 agencies. 14 species can be supported by 3 agencies. 191 remain species can be supported by 2 agencies.

**Keywords:** *Plants, medicine, edible, Cao Bang, Viet Nam.*

## INTRODUCTION

Medicinal plants and edible plants are very important and indispensable plants for human life. The development of each of these plants, although there have been many results and contributions to mankind, of each country and each region of each country, but have not yet brought about maximum efficiency in many aspects because there has not been an effective combination of the two fields of medicine and edible plants. Having a data link between medicinal plants and edible plants will help the development of functional food and medicine products to be effective.

The topic of choosing a research site in Cao Bang province of Vietnam, the purpose is to build a common data of medicinal plants and useful plants related to vegetable plants, edible plants (seeds/fruits) and plants for food animals and propose some solutions to contribute to the development of those plant species.

## MATERIALS AND METHODS

Data is built based on references [1-11], fieldwork in Cao Bang province for many years, with a focus on research in the years 2017 to 2022, information of specimens located at herbaria (HN: herbarium of Institute of Ecology and Biological Resources (IEBR), Vietnam Academy of Science and Technology (VAST); VNM: herbarium of Institute of Tropical Biology (ITB), VAST). Identification of plant specimens based on morphological comparison method. Collection of use value information of plant species based on references related to medicinal plants and useful plants. Application of Microsoft Access to analyze data.

Analyze data and propose some scientific solutions to contribute to the development of those plant species.

## RESULTS

Establishing a list of medicinal plant species that are eaten by animals and humans in Cao Bang province, Vietnam (Table 1).

Abbreviation for use value. Me: Medicinal plant; Ed: Edible plant; Ve: Vegetable plant; Fo: Food for animal; Fi: Fibre plant; Or: Ornamental plant; Ti: Timber; Es: Plant with essential oil product.

Abbreviation for agencies. Agr: agriculture agencies; Con: construction agencies; Ess: essential

oil companies; Fas: fashion companies; For: forestry agencies; Med: medicinal plant agencies; Orn: ornamental companies.

### **Proposing Some Solutions to Contribute to the Development of Such Medicinal Plant Species:**

**FIGURE 1.** Cooperation and comprehensive support from many agencies for research and development of medicinal plants that are eaten by animals and humans in Cao Bang province, Vietnam

## **DISCUSSION**

Specific data on will provide a clear direction for research and development of medicinal plants in Cao Bang province. If the proposal for cooperation is successful:

The agriculture agencies can support the research and development of 216 species. The medicinal plant agencies can support the research and development of 216 species. The construction agencies can support the research and development of 11 species. The essential oil agencies can support the research and development of 3 species. The fashion agencies can support the research and development of 8 species. The forestry agencies can support the research and development of 11 species.

The ornamental agencies can support the research and development of 5 species.

Each species can be supported by several agencies: 2 species (*Cleistocalyx operculatus*, *Diospyros kaki*) can be supported by 5 agencies (Agr, Med, For, Con, Fas). 9 species (*Aporosa dioica*, *Artocarpus heterophyllus*, *Baccaurea ramiflora*, *Bischofia javanica*, *Canarium bengalense*, *Diospyros malabarica*, *Garcinia oblongifolia*, *Illicium majus* and *Prunus cerasoides*) can be supported by 4 agencies (Agr, Med, For, Con). 7 species (*Boehmeria nivea*, *Oroxylum indicum*, *Pouzolzia sanguinea*, *Sida rhombifolia*, *Terminalia catappa*, *Trema orientalis* and *Artemisia vulgaris*) can be supported by 3 agencies (Agr, Med, Fas); 5 species (*Alpinia malaccensis*,

*Bambusa vulgaris*, *Crescentia cujete*, *Kalimeris indica* and *Saraca dives*) can be supported by 3 agencies (Agr Med, Orn). 2 species (*Chenopodium ambrosioides* and *Cyperus rotundus*) can be supported by 3 agencies (Agr, Med, Ess). 191 remain species can be supported by 2 agencies (Agr, Med).

Although the proposals are theoretical, but if the cooperation and comprehensive support from many agencies are achieved, the development of medicinal and edible plants will bring positive results. However, in our opinion, it is necessary to have a group that understands about plants, obtains the results of this study and connects cooperations, supports of agencies to uses of plants (Figure 1).

## CONCLUSION

A list of 216 medicinal plant species that are eaten by animals and humans in Cao Bang province has been compiled. A model built for research and development of those species based on comprehensive cooperations and supports from agriculture, construction, essential oil, fashion, forestry, medicinal plant and ornamental agencies.

## ACKNOWLEDGEMENTS

We thank the directors and curators of the herbaria HN and VNM for allowing study on herbarium specimens to identify species.

## FUNDING

Funding for this research was provided by project UDNDP.02/2022-2023.
